PROFILE

DevOps Engineer working with CI/CD scripting, container builds, Helm and OpenShift deployment configuration, quality gates and incident diagnosis in enterprise mobile banking. Independently built and operate a multi-VM Kubernetes platform, including delivery and recovery workflows. Production banking releases involve dedicated release and operations teams.

PROFESSIONAL EXPERIENCE

DevOps Engineer | BRI

Nov 2025 - Present

Enterprise mobile banking delivery, legacy and newer service estates

- Set up and maintain Bamboo plans, inline shell scripts, Helm-repository scripts and Dockerfile baselines for services across development, test, pre-production and production stages.
- Maintain environment-specific Helm values, ConfigMap and secret references, resource settings, probes and OpenShift rollout configuration in collaboration with development and platform teams.
- Support controlled isolated-to-existing production promotion; join Jira-based release reviews and troubleshoot rollouts with release and banking operations teams.
- Integrate SonarQube coverage, SAST and software composition checks. Resolved a misleading Go CI coverage result by correcting Bamboo execution and verifying report import.
- Investigate image/registry, Fluent Bit-Fluentd-Elasticsearch-Kibana logging, service dependencies and proxy or firewall configuration with responsible teams.

DevOps Engineer | PT Pinus Pintar Community

DeployAja and SIDRA

- Built and maintained GitHub Actions pipelines and Docker/Kubernetes deployment templates for application releases.
- Worked on Prometheus/Grafana monitoring, ingress routing and operational troubleshooting with developers and product owners.

INDEPENDENT PLATFORM & SELECTED WORK

Architecture, delivery boundaries and evidence-led examples

KUBERNETES PLATFORM | INDEPENDENT BUILD | 2026

Built and operate a KVM/libvirt environment with three control-plane VMs, three worker VMs, load-balancing VMs and separate CI, registry, observability, storage and database services. Zabisa and other applications run on the shared cluster. All VMs depend on one physical host; this is not physical high availability.

- Kubernetes platform: Calico networking, ingress-nginx, MetalLB, Vault secret injection, observability and MinIO media storage.
- Delivery: source quality checks, Jenkins, SonarQube, Trivy, SBOMs, immutable Harbor images, GitOps and reviewed Argo CD sync.
- Recovery practice: encrypted MySQL backup, isolated restore verification and revision-bound development/test rollout; no public production or recovery-time claim.

SELECTED TECHNICAL DECISIONS

- Go coverage: traced an apparent 0% report through Bamboo shell execution and Go coverage.out import until SonarQube loaded coverage and passed the quality gate.
- Bun CI experiment: prepared a Debian Bun 1.4.2 container and branch-specific Bamboo wrapper while keeping other branches on npm; full migration awaited the repository lockfile.
- Release automation: maintained Bamboo inline scripts and scripts versioned with Helm configuration for production handoffs; execution was shared with authorized operations teams.

TECHNICAL TOOLKIT

DELIVERY	Bamboo, Jenkins, GitHub Actions, GitOps, Argo CD, Bash
PLATFORM	Kubernetes, OpenShift, KVM/libvirt, Helm, Docker, Podman
SECURITY	SonarQube, SAST/SCA, Trivy, Vault, SBOM, Harbor, Nexus
OPERATIONS	Prometheus, Grafana, Fluent Bit, Fluentd, Elastic, Kibana
STORAGE	MySQL, MinIO, backup and isolated restore practice

TRAINING

DevOps / Cloud / Kubernetes course, PT Pinus Pintar Community IT, Semarang.
